

## Glass Restoration - Technical

### **BENEFITS OF THE NOVUS GLASS RESTORATION SYSTEM**

There are many benefits to the NOVUS Glass Restoration System as it compares to conventional glass scratch removal hand tools. The NOVUS Glass Restoration system is the most professional equipment available on the market. Below find a list of attributes that make the NOVUS Glass Restoration System so unique.

#### **The NOVUS Glass Restoration System is Self Contained**

- The NOVUS Glass Restoration System vacuum seals to the glass, which allows you to keep all of your polishing materials self-contained. This eliminates unnecessary mess, which is commonly associated with other scratch removal systems.
- The continuous flow of abrasive (slurry) through the system will cool the glass, thus allowing you to operate at 5,000 to 6,000 rpm's versus 1,000 to 3,000 rpm's with conventional systems. The ability to polish at close to 3 times the speed of conventional systems allows you to complete jobs in 1/3 of the time it would take using other methods.
- By re-circulating your abrasive through the system, you are able to drastically reduce operating expenses. With conventional systems you apply a paste or use a cerium oxide impregnated pad, which is a one-time application.

#### **The NOVUS Glass Restoration System has a Unique Design**

- We have incorporated a clutch mechanism, which will control the amount of pressure that the polishing pad has on the glass surface. This insures that you have the same amount of pressure from the polishing pad, at every point being polished. Conventional units require the operator to apply body pressure, which is very inconsistent and will create more distortion.
